Akshat Sharma

Becoming an AI Engineer

Merta City, Rajasthan, India

About Me

My name is **Akshat Sharma**, and I am currently working toward becoming an **AI Engineer**. My goal is to build intelligent applications that solve real-world problems using Machine Learning, Large Language Models, and Agentic AI.

I am continuously developing my skills through practical projects, structured learning, and hands-on experimentation with modern AI technologies.

Technical Skills

Python: The foundation of my AI and Machine Learning journey. I use Python for data analysis, model development, AI applications, and LLM-based systems.

Machine Learning: Experience with Scikit-learn and the complete ML workflow, including preprocessing, feature engineering, classification, regression, model evaluation, pipelines, and hyperparameter tuning.

Large Language Models: Learning how to build LLM-powered applications, use tool calling, work with structured outputs, and select the best model based on task requirements, accuracy, speed, cost, and capabilities.

Prompt Engineering: Practicing zero-shot, one-shot, few-shot and multi-shot prompting, structured prompts, clear instructions, and techniques for improving the reliability and consistency of AI responses.

Agentic AI: Exploring how AI systems can use tools, perform multi-step tasks, make decisions, and interact with external services to automate real-world workflows.

Gradio & Streamlit: Building interactive interfaces and deploying AI and Machine Learning applications.

Learning Journey

I am currently studying **LLM Engineering** and **Agentic AI** through courses created by **Ed Donner on Udemy**.

These courses are helping me move beyond traditional Machine Learning and understand how modern AI systems can understand natural language, use external tools, make decisions, and complete multi-step tasks.

Current Focus

- Building a strong foundation in Python and Machine Learning
- Developing practical skills with LLMs and LLM APIs
- Learning tool calling and AI application orchestration
- Understanding how to choose the right LLM for the right task
- Exploring Agentic AI and intelligent automation
- Building practical projects that solve real-world problems

Projects

■ House Price Predictor

Model: XGBRegressor (XGBoost)

Metrics: R^2 : **0.8853** | MAE: **\$16,393.43** | RMSE: **\$29,665.44** | CV R^2 : **0.8436**

Preprocessing: Missing-value imputation, StandardScaler, and OneHotEncoder.

Feature Engineering: Log transformation of SalePrice using log1p.

Tuning: GridSearchCV with 5-fold cross-validation.

Top Features: OverallQual, GarageCars, GrLivArea, TotalBsmtSF, KitchenQual.

This project helped me understand the complete Machine Learning workflow, from data preprocessing and feature engineering to model training, evaluation, and hyperparameter optimization.

■■ Rain in Australia

Model: LGBMClassifier (LightGBM)

Metrics: Accuracy: **84.13%** | ROC-AUC: **0.8975** | F1-Score: **0.6766**

Preprocessing: Median imputation, most-frequent imputation, and OneHotEncoder.

Feature Engineering: TempDiff, PressureDiff, HumidityDiff, Year, Month, and Season.

Tuning: GridSearchCV with 5-fold Stratified Cross-Validation.

Top Features: Pressure3pm, PressureDiff, Humidity3pm, HumidityDiff, Sunshine.

■ My Digital Twin

My Digital Twin is an AI-powered application designed to answer questions about me, including my career, technical skills, learning journey, projects, interests, and personal background.

The project uses an LLM to understand user questions and generate personalized responses based on information about me.

Key Technologies & Concepts

- Large Language Models (LLMs)
- LLM API calls
- Prompt Engineering
- One-shot and multi-shot prompting
- Tool Calling
- Telegram Notifications
- Gradio
- Python

Key Features

The Digital Twin can answer questions about my career goals, journey toward becoming an AI Engineer, technical skills, projects, current courses, learning journey, interests, and personal background.

The system can also use **tool calling** to perform actions beyond simply generating text. For example, the AI can trigger a Telegram notification when a specific action or condition occurs.

The application uses **Gradio** to provide an interactive user interface, while LLM calls and prompting techniques power the conversational intelligence behind the system.

This project helped me understand how modern LLM applications are built using Python, LLM APIs, prompt engineering, tool calling, and external integrations. It represents one of my first steps toward building more capable AI systems and agentic applications.

My Goal

My ultimate goal is to become a skilled **AI Engineer** capable of designing and building intelligent, practical, and production-ready AI applications.

I want to develop systems that do more than simply generate text. I want to build AI applications that can understand problems, access information when needed, use tools, make decisions, and complete meaningful tasks.

My journey is still in progress, but every project, course, and experiment is helping me move one step closer to becoming the AI Engineer I want to be.

I am a vegetarian, and my favorite dish is pav bhaji. My favorite sweet is rasgulla. I enjoy traveling, and my favorite place is my lovely Vrindavan.

My best friend is Kanji — the love of my life. ❤️👤
